MCP	Massachusetts Contingency Plan
MNA	Monitored Natural Attenuation
MWRA	Massachusetts Water Resource Authority
NACIP	Navy Assessment and Control of Installation Pollutants
NAS	Naval Air Station
NAVFAC	Naval Facilities Engineering Command
NAVY	U.S. Department of Navy
NCP	National Contingency Plan
NFA	No Further Action
NPDES	National Pollutant Discharge Elimination System
NPL	National Priorities List
OWS	oil-water separator
PA	Preliminary Assessment
PAH	Polycyclic aromatic hydrocarbon
PCB	Polychlorinated biphenyl
PCE	Tetrachloroethene
PDI	Pre-Design Investigation
PFC	Perfluorinated compounds
PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctane sulfonate
PHA	Provisional Health Advisory
PMO	Program Management Office
ppm	parts per million
PRAP	Proposed Remedial Action Plan
PRB	Permeable Reactive Barrier

PRG	Preliminary Remediation Goals
RA	Remedial Action
RACR	Remedial Action Completion Report
RCRA	Resource Conservation and Recovery Act
RD	Remedial Design
RDA	Rubble Disposal Area
RecD	Recreation Zoning District
RG	Remedial Goal
RIA	Review Item Area
RI	Remedial Investigation
ROD	Record of Decision
RTN	Release Tracking Number
SARA	Superfund Amendments and Reauthorization Act
SI	Site Inspection
SL	Small Landfill
SMP	Site Management Plan
SRA	Solvent Release Area
SSA	Site Screening Area
SSP	Site Screening Process
STP	Sewage Treatment Plant
SVOC	Semi-volatile organic compound
TAL/TCL	Target Analyte List/Target Compound List
TCE	Trichloroethylene
TCLP	Toxicity Characteristic Leaching Procedure
TLF	Tile Leach Field
TPH	Total petroleum hydrocarbons
TtEC	TetraTech EC
UST	Underground storage tank
VCD	Village Center Zoning District
VOC	Volatile organic compound
WGL	West Gate Landfill

1.0 PROJECT BACKGROUND

This Site Management Plan (SMP) is the 15th Annual Update for the former Naval Air Station (NAS) South Weymouth, prepared for the benefit of the NAS South Weymouth Base Closure and Realignment Act of 1990 (BRAC) Cleanup Team (BCT). The SMP serves as a management tool for planning, reviewing, and setting priorities for environmental investigative and remedial response activities conducted under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The SMP establishes the schedule for implementation of these investigative and remedial response activities at former NAS South Weymouth in accordance with the Federal Facilities Agreement (FFA) between the U.S. Environmental Protection Agency (EPA) New England Region and the U.S. Department of the Navy (Navy), effective April 7, 2000. The FFA establishes the roles and responsibilities of the Navy and the EPA in the performance of investigations and completion of necessary remedial actions at NAS South Weymouth. The EPA placed NAS South Weymouth on the National Priorities List (NPL) in 1994.

The SMP is revised annually in accordance with the FFA to adjust priorities and schedules, as additional information (including funding availability) becomes available. This document was prepared by Resolution Consultants (Resolution) for the Navy and the Naval Facilities Engineering Command (NAVFAC).

The Installation Restoration (IR) Program at the former NAS South Weymouth is funded by the Navy's BRAC program. The SMP is appended to the FFA and sets priorities and the schedules for investigations and remedial actions required pursuant to the FFA. The FFA allows for annual adjustment in scheduled activities for reasons such as federal budgetary priorities and constraints, changes in scope, or other unanticipated events. The rationale for the sequence of future investigation and remediation activities and the estimated schedule for completion of these activities, with detailed schedules for funded activities in federal Fiscal Year 2015, are included in this revision of the SMP.

1.1 Background

NAS South Weymouth was administratively closed on September 30, 1997 under the Defense BRAC, Public Law 101-510, as part of the BRAC Commission's 1995 Base Closure List (BRAC IV). Operational closure of the NAS South Weymouth airfield (through transfer of aircraft to other Navy facilities and personnel reduction) commenced on September 30, 1996.

As a result of the operational closure, the facility was placed in caretaker status under the supervision of Northern Division, NAVFAC, later known as Engineering Field Activity Northeast

(EFANE). The facility is now under the supervision of the BRAC Program Management Office (PMO) East, Philadelphia, Pennsylvania.

1.1.1 Installation Description

The Main Base of the former NAS South Weymouth installation is located approximately 15 miles southeast of Boston, Massachusetts, in Norfolk and Plymouth counties in the Towns of Weymouth, Abington, and Rockland. The Main Base encompasses approximately 1,444 acres, as shown in Figure 1-1.

The facility is located in an urban area and is partially developed, although wetlands and forested areas remain. The topography is relatively flat and characterized by bedrock outcrops, wetland areas, and small stream channels. The topography has been altered and regraded throughout its operational history by the Navy during construction of the runways, taxiways, and related facilities. Portions of the Base property have been transferred to the Local Redevelopment Authority (LRA), and are undergoing redevelopment.

1.1.2 Installation History

NAS South Weymouth originated with the Naval Expansion Act of 1940, which authorized construction of 48 non-rigid airships (blimps) to be used for coastal anti-submarine patrols. In September 1941, the Navy purchased a largely undeveloped tract of land in the Towns of Weymouth, Rockland, and Abington, Massachusetts and began construction. NAS South Weymouth was commissioned on March 1, 1942.

The immediate strategic need for NAS South Weymouth disappeared with the end of World War II. On August 8, 1945, the installation was reduced to the status of a Naval Aviation Facility and designated as an aircraft storage site. The installation was deactivated in June 1949 and remained idle until early 1951 when Congress appropriated funding for the construction of runways, hangars, buildings, fuel storage areas, and other facilities at the installation. A Naval Air Development Unit designed to develop and test anti-submarine and air defense equipment moved to the installation in July 1953.

NAS South Weymouth regained its status as a "Naval Air Station" in December 1953 when training facilities from Squantum NAS (Quincy, MA) were transferred to the Main Base in South Weymouth. The increased use of jet aircraft and the lack of adequate space for runway expansion precipitated the transfer of Squantum's activities to South Weymouth.

NAS South Weymouth became the home base for the blimps of Airship Early Warning Squadron One in 1954. In January 1957, the squadron's airships operated continuous radar patrols in

extreme weather conditions off the New England coast, demonstrating the blimps' capacity for all-weather operations. The Navy withdrew blimps from active service in 1961, and NAS South Weymouth became solely a Naval Air Reserve facility. The buildings and structures that had supported the airship operations were demolished during the mid-1960s and replaced with facilities designed to accommodate fixed-wing aircraft.

In September 1996 aircraft from the Naval Air Reserve facility were moved to Brunswick NAS in Maine. Between 1996 and 1997, NAS South Weymouth provided facilities, ground training, and limited surface training to Marine and Naval reserve units. Administrative closure was completed in September 1997.

1.1.3 Installation Restoration Program History

The Navy conducted a Preliminary Assessment (PA) under the IR Program in March 1988. The PA consisted of a records search, site visit, and interviews with facility personnel. The PA report, prepared by Argonne National Laboratory, identified five potential hazardous waste sites based on past practices: Site 1, the West Gate Landfill (WGL); Site 2, the Rubble Disposal Area (RDA); Site 3, the Small Landfill (SL); Site 4, the Former Fire Training Area (FFTA); and Site 5, the Tile Leach Field (TLF).

The Navy completed a Site Inspection (SI), prepared by Baker Environmental, Inc., in December 1991. The SI investigated the five potential sites identified in the PA, as well as three additional sites the Navy added to the program: Site 6, the Fuel Farm; Site 7, the former Sewage Treatment Plant (STP); and Site 8, the Abandoned Bladder Tank Fuel Storage Area (ABTFSA). The SI included site walkovers; geophysical surveys; installation of monitoring wells; and laboratory analysis of soil, sediment, surface water, and groundwater samples.

The SI report identified no imminent hazards to human health or the environment due to the sites. It recommended No Further Action (NFA) for Sites 5 and 7, and that a Remedial Investigation/Feasibility Study (RI/FS) be conducted for Sites 1, 2, 3, 4, 6, and 8. In response to concerns from EPA and the State, the Navy proposed to conduct a Supplemental SI for Sites 5 and 7 during the completion of the RI. Subsequently, the Navy, EPA, and the State agreed that Site 6 (the Fuel Farm) could best be addressed in a manner consistent with provisions of the Massachusetts Contingency Plan (MCP) and, as such, Site 6 was not included in the RI.

The Navy conducted the field investigation for the Phase I RI from December 1995 through June 1996. The investigation included collection and analysis of surface water, groundwater, soil, and sediment; assessment of the nature and extent of contamination; an evaluation of the

fate and transport of the constituents of concern; and the assessment of risk to human and ecological receptors. The investigation addressed the following seven IR sites:

- Site 1 – West Gate Landfill;
- Site 2 – Rubble Disposal Area;
- Site 3 – Small Landfill;
- Site 4 – Fire Fighting Training Area;
- Site 5 – Tile Leach Field;
- Site 7 – Sewage Treatment Plant; and
- Site 8 – Abandoned Bladder Tank Fuel Storage Area.

The Phase I RI addressed the original seven IR Program sites and was finalized in July 1998 following extensive reviews and comments by the EPA and the Massachusetts Department of Environmental Protection (MassDEP). The Navy, EPA, and MassDEP agreed that the Navy would conduct a Phase II RI. The primary goals of the Phase II RI were as follows:

- To further characterize the sites by investigating the bedrock groundwater migration pathway; collect a replacement set of groundwater data; and add site-specific parameters including ethylene dibromide, methyl tertiary-butyl ether, 1,4-dioxane, and ammonium perchlorate.
- To refine the Base Conceptual Site Models (CSMs) and update the ongoing Geographic Information System (GIS) program.
- To revise the Human Health Risk Assessment (HHRA) to include the Phase II data and implement procedural changes identified during review of the Phase I HHRA.
- To refine the Tier I Ecological Risk Assessment (ERA) and prepare a Tier II ERA.

As part of the Base closure, an Environmental Baseline Survey (EBS) was conducted to support the Navy's compliance with CERCLA Section 120, as amended by Public Law 102-426, Community Environmental Response Facilitation Act, and state and local real property transfer disclosure notification regulations. The EBS was conducted in parallel to the Navy's ongoing RI/FS efforts. The purpose of the EBS was to support ongoing environmental restoration programs, base closure, and anticipated property transfers/leases. Phase I EBS investigations were conducted in October and November 1995, for those areas of the Base property not already addressed by the Department of Defense (DOD) IR or MCP programs (MassDEP, 1996). The information collected

during the Phase I EBS investigations was used to identify specific areas of potential concern and to recommend the level of further investigation required at each of these locations. Areas identified in the Phase I EBS Report (issued in November 1996) as requiring additional investigation were designated as Phase II EBS Review Item Areas (RIAs). Based on the Phase II EBS investigations, RIAs where analytical results of environmental samples indicated concentrations of chemicals exceeding screening criteria were designated as Areas of Concern (AOCs). AOCs were then investigated under CERCLA.

After the Phase I RI and Phase I EBS were completed, the Navy incorporated the following three additional sites into the IR Program:

- Site 9 – Building 81 (Marine Air Reserve Training Building) was previously investigated as a petroleum site in a manner consistent with the MCP. After completion of an in-situ chemical oxidation (ISCO) pilot study designed to reduce concentrations of chlorinated solvents and petroleum derivatives in groundwater, the Navy conducted an RI for the site. Further details on IR Site 9 are provided in Section 2.9.
- Site 10 – Building 82 (Hangar 2) was previously investigated as a petroleum site in a manner consistent with the MCP. Two areas originally investigated as part of the Phase II EBS, RIAs 30A and 107, both of which were related to spills on the Hangar 2 aircraft parking apron, are also now included in Site 10. Further details on IR Site 10 are provided in Section 2.10.
- Site 11 – The Solvent Release Area was previously investigated as part of the Phase II EBS and then as CERCLA AOC 108 due to the presence of chlorinated solvents in groundwater. The Navy conducted a geophysical investigation and source delineation in fall 2004. Further details on IR Site 11 are provided in Section 2.11.

In accordance with the FFA, the Navy is managing the CERCLA RI/FS and Remedial Design/Remedial Action (RD/RA) process (as necessary) at the 10 IR Program sites. Note that Former IR Site 6, the former Fuel Farm, was transferred out of the IR Program and was addressed as a petroleum site under the underground storage tank (UST) program and in a manner consistent with the MCP.

1.2 Organization of the SMP

This SMP is divided into six sections, with associated tables, figures, and one appendix. Section 1 includes an introduction to the scope and purpose of the SMP, a description of the installation, a brief history of its development, and an introduction to the IR Program and the IR Program sites. Section 2 contains a synopsis of the CERCLA remedial process. Section 3

describes the individual IR Program sites. Section 4 discusses the development of the sequence of activities and target dates for primary and secondary documents. Section 5 discusses the role of the South Weymouth BCT. Section 6 identifies the location of relevant documents. Appendix A contains the site schedules.

2.0 REGULATORY PROCESS ACTIVITIES

The Navy implemented the Navy Assessment and Control of Installation Pollutants (NACIP) Program in 1980. The NACIP Program was renamed the IR Program with the passage of the Superfund Amendments and Reauthorization Act (SARA) in 1986. Phases of the NACIP Program were changed to ensure procedural consistency between the IR Program and CERCLA and the National Oil and Hazardous Substance Pollution Contingency Plan (NCP). The IR Program terminology and phases in accordance with the NCP are as follows:

- PA/SI – Preliminary Assessment/Site Inspection;
- RI/FS – Remedial Investigation/Feasibility Study;
- PRAP/ROD – Proposed Remedial Action Plan (Proposed Plan)/Record of Decision; and
- RD/RA – Remedial Design/Remedial Action.

At former NAS South Weymouth, the PA and SI were conducted under the IR program. The PA was completed in 1988 and the SI was issued in December 1991. The IR Program parallels CERCLA/SARA, informally known as Superfund. Under the CERCLA/SARA Program, abandoned waste sites that potentially contain hazardous substances that may endanger public health, welfare, or the environment undergo several phases of environmental investigation. Completion of these phases ultimately determines the need for a remedy and, if necessary, the selection and implementation of the remedy for the site.

A description of the general CERCLA remedial process is provided below. The history of the IR Program at former NAS South Weymouth is summarized in Section 1.1.3 of the SMP.

2.1 Initial Assessment/Screening Process

The PA is the initial study conducted under CERCLA at a site in response to an actual release or threat of release of a hazardous substance. The PA relies heavily on existing information and is limited in scope. If the PA identifies sites or study areas as potentially posing a threat to human health or the environment, an SI is conducted.

The SI usually consists of a site walkover, file reviews, interviews with appropriate personnel, and limited sampling of environmental media. If further investigation is warranted under CERCLA after the SI phase, the study area becomes an IR Program site, and an RI/FS is completed.

At federal facilities where the responsible federal agency has entered into an FFA with the EPA, the Site Screening Process (SSP) investigation is the initial study under CERCLA in response to a suspected hazardous substance release or threat of release. The SSP is the mechanism for determining whether the sites of such suspected releases or threats of releases, called Site Screening Areas (SSAs), require further study through the RI/FS process (or as part of a CERCLA removal action) because they pose a threat or potential threat to human or ecological receptors. At former NAS South Weymouth, the Navy identified a number of SSAs before signing the FFA. Those SSAs are listed in the FFA. EBS Review Item Area Decision Documents meet the substantive requirements of an SSP report and have been issued in lieu of SSP reports. Any newly identified SSAs will proceed through the SSP in accordance with the FFA.

Upon the conclusion of an SSP investigation/EBS Phase II investigation, an SSP report/EBS Decision Document will be reviewed by the BCT and will document the decision whether or not to address the site under the IR Program.

2.2 Remedial Investigation/Feasibility Study

The RI/FS is the next phase of the CERCLA remedial process. Extensive sampling and analyses are performed for the RI. The RI is designed to determine the nature and extent of contamination at the site by collecting and analyzing information about chemicals of potential concern (COPCs), potential migration pathways, toxicity and persistence of COPCs, and potential (risk) for adverse impacts to human health and/or the environment. HHRAs and ERAs are completed as part of the RI.

The FS is used to develop remedial action objectives, identify Applicable or Relevant and Appropriate Requirements (ARARs) and develop, screen, and analyze remedial alternatives. The FS evaluates the alternatives relative to the first seven CERCLA criteria (protection of human health and the environment; compliance with ARARs; reduction of toxicity, mobility, or volume through treatment; short-term effectiveness; long-term effectiveness; implementability; and cost). The last two criteria, support agency acceptance and community acceptance, are established during the proposed remedial action plan (PRAP) and ROD stages.

2.3 Proposed Remedial Action Plan/Record of Decision

After completion of the RI/FS, a Proposed Plan is prepared and issued to the public, and a notice of availability published in local newspapers. The Proposed Plan presents the Navy's preferred alternative for the site. The NCP mandates a minimum 30-day public comment period and provides for a minimum 30-day extension if requested. Typically, a public informational meeting is held, followed by a public hearing to receive transcribed comments.

Following the end of the public comment period, the BCT reviews the public comments. If the BCT concurs that there are no significant changes warranted for the Proposed Plan based on the public comments, the Navy prepares a Responsiveness Summary. The Responsiveness Summary, which provides written responses to the public comments, is issued as an appendix to the ROD. The ROD is the formal, legally enforceable document that identifies the chosen remedial alternative(s).

2.4 Removal Action

A removal action may be completed prior to or during the RI/FS to reduce the threat to human health or the environment by removing released hazardous substances or reducing potential exposure pathways. There are two types of removal actions: time critical and non-time critical. Time critical removal actions are taken when there is an imminent and substantial threat to human health or the environment. Non-time critical removal actions can be used whenever a planning period of at least 6 months exists before a removal action can be initiated.

To enable the selection of the best remedial alternative for non-time critical removal actions, an Engineering Evaluation/Cost Analysis (EE/CA) is prepared. Unlike the FS, the EE/CA focuses only on the material to be removed, and analyzes the effectiveness, implementability, and costs of removal. An Action Memorandum is completed prior to a formal public comment period. It is the primary decision document that substantiates the need for the removal action, identifies the proposed response and explains the rationale for the removal action.

Subsequent to a removal action, the RI/FS may conclude that NFA is required to reduce the threat to human health and the environment. In this case, an NFA ROD would be issued and the CERCLA remedial process would be concluded. A removal action may be media-specific and not address all risks posed by a site. Risks not addressed by the removal action are addressed by the RI/FS.

2.5 Interim Removal Action

An Interim Remedial Action (IRA) may be completed prior to or during the RI/FS to reduce the threat to human health or the environment by removing released hazardous substances or reducing potential exposure pathways. To facilitate selection of the best remedial alternative for an interim remedial action, a Focused FS is prepared. An interim ROD is issued, and interim RD/RA activities are initiated. After implementation of the interim remedial action, the RI/FS may conclude that NFA is required to reduce the threat to human health and the environment. In this case, an NFA ROD would be issued and the CERCLA remedial process would be concluded.

2.6 Remedial Design/Remedial Action

The ROD establishes the type of remedy and the performance standards to be obtained during the RD/RA. The RD often proceeds in a stepped process and addresses detailed design issues not addressed during the FS. The RA involves implementation of the RD. The RA Design Schedule, as agreed to by all parties to the FFA, will result in commencement of the Remedial Action (i.e., substantial physical onsite activity), within 15 months (450 days) of the execution and signature of the ROD.

3.0 SITE DESCRIPTIONS

The following sections provide a brief description and history of each IR site at former NAS South Weymouth.

3.1 Site 1 - West Gate Landfill

IR Program Site 1, the WGL, comprises approximately 5.23 acres located near the mid-point of the western border of former NAS South Weymouth, as shown in Figure 3-1. The WGL was an active landfill from the 1940s until 1972; prior to that time, it was a swamp. During the period of its use, domestic waste was burned and buried in an unlined area at the site. Small amounts of flammable materials were also burned at this site according to Base personnel, as reported in the SI. Due to insufficient information regarding the nature of materials that were disposed at the WGL, it was assumed that all types of waste from the Main Base went to the landfill during the period of use. Materials noted during the investigations included metal, asphalt, bricks, concrete, plastics, wires, bottles, cans, rubber tubes and hoses, and other debris. The approximate fill thickness is 10 feet; the volume of fill is estimated to be approximately 85,000 cubic yards (CY).

3.1.1 Site Inspection

The Navy conducted geophysical studies as part of the SI in order to identify the extent of the disposal area and also collected surface water, sediment, soil, and groundwater samples for Target Analyte List/Target Compound List (TAL/TCL) laboratory analysis and reporting. The major conclusions of the SI were as follows: the extent of the landfill was smaller than anticipated based on results of the geophysical survey and advancement of soil borings; and volatile organic compounds (VOCs) were not detected in surface water or groundwater. However, no wells were actually installed hydraulically downgradient of the landfill. Pesticides/polychlorinated biphenyls (PCBs) were not detected except in an upstream sediment sample. Trace to low levels of several VOCs and semi-volatile organic compounds (SVOCs) were detected in soil. The 1988 SI report recommended further investigation including installation of additional monitoring wells, evaluation of potential upstream sources, and a soil gas survey.

3.1.2 Remedial Investigation Phase I

Soil, groundwater, and sediment samples were collected at the WGL during the Phase I RI in May 1996. Test pit and borehole observations during the RI revealed a variety of debris to a depth of approximately 8 feet below ground surface (bgs). Organic compounds (polycyclic aromatic hydrocarbons [PAHs], pesticides, and PCBs) were detected in shallow soil samples. Relatively few organic compounds were detected in groundwater, surface soil, or sediment

samples. Inorganic compounds were detected in all sampled media. PAHs and pesticides were detected in potential leachate and leachate-stained soils. Subsurface soil samples were also analyzed for Resource Conservation and Recovery Act (RCRA) characteristics; i.e., Toxicity Characteristic Leaching Procedure (TCLP), ignitability, reactivity, and corrosivity. No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by contaminants of concern (COCs) at the WGL site were within the EPA acceptable risk range for industrial use. Under a future residential use scenario, the risks associated with exposure to the concentrations of PCBs and inorganics were not within acceptable risk ranges. The Tier I ERA results indicated no significant risk associated with surface water or sediment.

3.1.3 Remedial Investigation Phase II

The Phase II RI at the WGL focused on the following: evaluation of PCBs in surface soil through collection of approximately 40 surface soil samples for PCB immunoassay screening, with approximately 10 samples for laboratory analyses; collection of approximately 10 subsurface soil samples for analysis for non-Contract Laboratory Program parameters of interest; installation of several new groundwater monitoring wells screened in deep overburden and bedrock; sampling of the new and several existing wells; collection of additional surface water and sediment samples; and further ecological characterization. The characterization included tissue sampling, toxicity testing, and a benthic macro-invertebrate community survey.

The results of the Phase II RI are summarized as follows: several compounds including PAHs, PCBs, dioxins, arsenic, chromium, lead, and mercury were detected at levels exceeding background, primarily in surface soil. These compounds contribute to exceedances of human health risk thresholds for all exposure scenarios that were assessed. Ecological risk thresholds for terrestrial invertebrate and wildlife receptors were also exceeded. However, there were no exceedances for terrestrial plants or French Stream aquatic receptors. The Final RI was issued in April 2002.

3.1.4 Feasibility Study

The Final FS to develop and evaluate remedial alternatives was completed in January 2003. The FS document indicated that if groundwater were extracted from the aquifer, the influent aquifer condition would not necessitate treatment beyond standard municipal-type treatment used by drinking water treatment facilities. As such, the FS document focused on reducing or

eliminating potential exposure to COCs on the surface of the landfill through either removal or capping of impacted materials.

Eliminate human and ecological exposure to the surface of the landfill.

Remedial objectives identified for the West Gate Landfill included:

- Minimize erosion and deposition of surface soil and landfill material into the adjacent wetlands.
- Remove visible landfill material from the palustrine wetlands adjacent to the WGL, and restore the wetlands impacted by the removal.
- Meet state regulations and TSCA requirements regarding closing a landfill, for those alternatives that include landfill capping.
- Prevent human exposure to groundwater containing contaminant concentrations in excess of federal or more stringent state drinking water standards, or posing an unacceptable risk to human health.

Six alternatives were identified:

- WGL-1: No Action;
- WGL-2: Limited Action;
- WGL-3: Construct a Soil Cap;
- WGL-4: Construct a Flexible Membrane Liner (FML) Cover;
- WGL-5: Remove and Dispose of all WGL Materials Off-Site; and
- WGL-6: Remove WGL Materials and Dispose of a at Newly-Constructed Landfill On-Site.

3.1.5 Proposed Plan

The Navy issued the final Proposed Plan on May 21, 2007. The preferred alternative in the Proposed Plan included constructing a soil cover over the landfill, long-term monitoring of environmental media, and institutional controls to limit access to the area.

3.1.6 Record of Decision

The Record of Decision (ROD) which documents the selected remedy – soil cover, long-term monitoring, and institutional controls, was signed by the Navy on September 21, 2007 and the

EPA on September 28, 2007 respectively. The MassDEP issued a letter of concurrence dated September 28, 2007.

3.1.7 Post-ROD Activities

The WGL remedial action activities commenced in December 2008. A pre-design investigation (PDI) was completed in 2010 per the ROD to provide additional information for the remedial design. A Memorandum for the Record, issued in May 2010, documented a minor design change to the cover materials for the use of a flexible membrane liner material for the landfill cover instead of clay or soil. The remedial design was completed and construction of the landfill cover system began in the summer of 2010. The remedial design for the landfill cover system follows guidance provided in federal regulations in 40 CFR 761.1(a)(7) and the Massachusetts Solid Waste regulations in 310 CMR 19.000. The design goal for the cover system stated in the ROD is to eliminate direct contact with the landfill materials. The landfill cover system complies with the general performance standards in 310 CMR 19.112.

An Explanation of Significant Differences (ESD) was signed by the Navy on August 30, 2010 and by EPA on September 2, 2010 respectively. The ESD modified the remedy specified in the ROD to allow soils excavated from the STP and AOC 55C sites to be used as common fill in the subgrade layer of the cover system. Following completion of the ESD, the soil stockpiles were moved from the STP and AOC 55C sites to the WGL and used to construct the subgrade layer. The subgrade layer with the consolidated soil from the STP and AOC 55C sites was completed in September 2010.

The Navy completed construction of the landfill cover system in the summer of 2011. A land use control implementation plan (LUCIP) for the site was completed and implemented in 2011. Annual compliance inspections are conducted at the WGL in accordance with the ROD and the LUCIP to verify that the land use controls (LUCs) are in place and the LUC objectives are being met. The annual LUC inspection is performed each November; the most recent annual LUC inspection for the WGL was performed on September 23, 2013.

Post-closure activities, including long term monitoring, wetland inspections, and operations and maintenance inspections, commenced in December 2011. Long Term Monitoring (LTM) events and operations and maintenance inspections were conducted on a quarterly basis for the first two years of the LTM program (December 2011 through September 2013). Once a larger data set (i.e. more than two full years of monitoring data) has been evaluated, the sampling frequency may be reduced or certain analytical parameters eliminated. Wetland inspections began in the fall of 2011 and were conducted on a semi-annual basis (spring and fall) until they were discontinued at the end of 2014.

3.2 Site 2 - Rubble Disposal Area

IR Program Site 2 comprises approximately 3.8 acres and is situated approximately 1,000 feet east of the eastern end of Runway 8-26, along the western bank of the Old Swamp River as illustrated in Figure 3-2. Much of the RDA was created by filling in the low swampy area along the western bank. The RDA principally received building debris from onsite sources. In 1978, The Gymnasium/Movie Theater (Building No. 21) was destroyed by fire. Debris from the fire was disposed of at the RDA. Disposal of materials to the RDA ceased in the mid-1980s. According to the SI report, NAS South Weymouth personnel indicated that hazardous waste also might have been disposed at this site. The exact nature of this waste was unknown, although the wastes were reported to possibly include transformers containing PCBs. The material observed during investigations included glass, concrete, metal, asphalt, wires, wood, and boulders.

3.2.1 Site Inspection

The Navy conducted geophysical studies at the RDA as part of the SI activities in order to identify the extent of the disposal area and also collected surface water, sediment, soil, and groundwater samples for TAL/TCL laboratory analyses and reporting. The SI report concluded that the extent of the RDA was smaller than anticipated; however, it was confirmed that large amounts of construction debris, including metal, were present in the disposal area. The extent of debris in the northeast corner was not fully delineated.

Although only trace to low levels of VOCs and elevated levels of iron and manganese were detected in groundwater, the wells were not located downgradient of the main portion of the RDA. No pesticides/PCBs, VOCs, or SVOCs were detected in surface water, and only several organic compounds were detected in sediment. VOCs and SVOCs (primarily PAHs associated with asphalt) were detected in soil in the RDA. The 1991 SI report recommended further investigation.

3.2.2 Remedial Investigation Phase I

Soil, groundwater, and sediment samples were collected during the Phase I RI in May 1996 at the RDA. Boulders and concrete rubble were observed in test pits and boreholes. Organic compounds (PAHs, pesticides, and PCBs) were detected in shallow soil and sediment samples. Relatively few organic compounds were detected in groundwater and surface soil samples. Inorganic compounds were detected in all sampled media. Subsurface soil samples were also analyzed for RCRA characteristics; i.e., TCLP, ignitability, reactivity, and corrosivity. No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by COCs at the RDA site were found to be within the EPA acceptable risk range for industrial usage. Under a hypothetical future residential use scenario, the risks associated with exposure to concentrations of PCBs, pesticides, and inorganics were not within acceptable risk ranges. The Tier I ERA results indicated that there was no significant risk associated with surface water and sediment.

3.2.3 Remedial Investigation Phase II

The focus of the Phase II RI for the RDA was to further characterize the site in the regionally downgradient (southeastern) direction. Several surface soil samples were collected to support the ecological characterization. Additional soil borings were installed to further characterize the geology and to collect soil samples for dioxin analyses. New wells were installed and screened in the deep overburden and competent bedrock. Groundwater from the new and existing wells was sampled; the primary focus was to characterize inorganics in groundwater at the site.

Extensive immunoassay screening for PCBs was conducted to further delineate the distribution of PCBs in sediment and hydric soil in the forested swamp adjacent to the Old Swamp River. Screening data were used to select surface water and sediment samples for confirmatory laboratory analyses.

Additional samples were collected to support a Tier II ecological characterization which included tissue sampling, toxicity testing, and a benthic macro-invertebrate community survey within the Old Swamp River.

The Final RI Report was issued in January 2001. Results of the Phase II RI indicated that the depth to groundwater was 2 to 7 feet bgs, and that groundwater flows to the east, towards Old Swamp River. Arsenic and manganese in groundwater were reported at concentrations that exceeded background, but did not exceed the applicable drinking water standards. An area of hydric soil at the northeast edge of the landfill contained PCBs concentrations which posed potential risk to ecological receptors.

3.2.4 Feasibility Study

The Final FS was issued in March 2002. Remedial objectives identified for the RDA included:

- minimize erosion and deposition into adjacent wetlands;
- achieve state landfill closure requirements; and
- eliminate or minimize ecological exposure to PCBs in the northeastern portion of the site.

Seven alternatives were identified:

- RDA-1: No Action;
- RDA-2: Limited Action (surface restoration);
- RDA-3: Permeable Soil Cap for PCBs and Landfill Material;
- RDA-4: Low-permeability Membrane Cap for PCB and Landfill Material;
- RDA-5: Excavation and Offsite Disposal of PCB Material, and Permeable Soil Cap for Landfill Material;
- RDA-6: Excavation and Offsite Disposal of PCB and Landfill Material; and
- RDA-7: Excavation of PCB and Landfill Material, and Containment at a New Onsite Location.

The Final FS indicated that if groundwater were extracted from the aquifer, the influent aquifer condition would not necessitate treatment for arsenic or manganese beyond the typical solids removal processes inherent within water supplies (such as sequestration, sedimentation, and/or filtration). As such, the Final FS focused on reducing or eliminating potential exposure to PCBs in the nearby hydric soil through removal. The Final FS also included capping and removal options for the landfill if compliance with state solid waste landfill closure requirements is desired under the CERCLA program.

3.2.5 Proposed Plan

The Navy issued the final Proposed Plan on February 24, 2003. The preferred alternative in the Proposed Plan included removal and off-site disposal of PCB-impacted soil from the wetland area, constructing a soil cover on the former disposal area, long-term monitoring, and institutional controls.

3.2.6 Record of Decision

The Navy and EPA signed the Final ROD in December 2003. The selected remedy was removal and off-site disposal of PCB-impacted soil from the wetland area, constructing a soil cover on the former disposal area, long-term monitoring, and institutional controls.

3.2.7 Post-ROD Activities

The Navy completed construction of the soil cover in 2005. Post-closure activities, including long-term monitoring and operations and maintenance, began in 2007 and continue currently in accordance with the approved post-closure plans. A LUCIP for the site has been completed and

implemented. An ESD was completed in 2010 to clarify the intent of the ROD and establish Monitored Natural Attenuation (MNA) as the remedy for groundwater. The Navy agreed to calculate a site-specific background manganese concentration in conjunction with the MNA groundwater remedy established in the ESD. However, at the April 2013 BRAC Cleanup Team BCT meeting, it was determined that a site-specific background study is not currently warranted. It was noted that during the next five-year review, it may be appropriate to identify the EPA manganese public health advisory as a target for the RDA or suggest that a site-specific background value be developed in the future. Five-year reviews for former NAS South Weymouth were completed in July 2009 and July 2014. The five-year reviews included detailed reviews of the RDA remedy and evaluation of its long-term protectiveness of human health and the environment. The second five-year review recommended continued monitoring of manganese concentration trends. The third five-year review will be completed by July 2019.

A second ESD was completed in early 2012 to allow the construction of a portion of the East-West Parkway abutting the RDA as part of the re-development of the former Base. This ESD included alterations to the post and rail fence and perimeter drainage swale as well as removal and replacement of some monitoring wells and sampling locations.

A supplemental landfill gas investigation report was issued in the summer of 2011. The Navy designed a corrective action to mitigate the off-site migration of landfill gas, which was implemented in 2013. Landfill gas monitoring points were monitored monthly during 2014 to evaluate if the system is operating successfully. The mitigation system has been effective in reducing methane levels; however, there are still some areas with elevated methane levels. A Remedial Action Completion Report (RACR) will be prepared in 2015 to document the corrective action and next steps required.

Site 3: Small Landfill

IR Program Site 3 is an approximately 0.8-acre capped landfill located east of the Old Swamp River as depicted in Figure 3-3. The SL is approximately 9 feet deep, containing an estimated 12,000 CY of fill. The SL is located on the western side of a ridge which trends northwest-southeast. According to information gathered during the PA, the SL received concrete rubble and tree stumps for a brief period of time ending in the mid-1980s. The SL reportedly was not used as extensively as the WGL. Materials found during the investigations included aluminum, steel, rubber tubing, metal pipes and rods, bottles and cans, electrical wires, concrete, boulders, wood debris, asphalt, railroad ties, and plastic materials.

3.2.8 Site Inspection

The Navy conducted geophysical studies as part of the SI in order to identify the extent of the SL and also collected soil and groundwater samples for TAL/TCL laboratory analyses and

reporting. Only trace levels of VOCs and low levels of SVOCs were reported in soil. In addition, PCBs and pesticides were not detected, and inorganics in soil did not exceed regulatory standards. In groundwater, several inorganics, including manganese, antimony, cadmium, and silver, were reported at levels slightly exceeding regulatory standards. The 1991 SI report recommended that a preliminary risk assessment be performed.

3.2.9 Remedial Investigation Phase I

Soil and groundwater samples were collected during the Phase I RI in May 1996. Concrete and other debris were observed in test pits and boreholes to a depth of approximately 12 feet. Organic compounds (PAHs and pesticides) were detected in shallow soil samples. Relatively few organic compounds were detected in groundwater and subsurface soil samples. Inorganic compounds were detected in all sampled media. Subsurface soil samples were also analyzed for RCRA characteristics (i.e., TCLP, ignitability, reactivity, and corrosivity). No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by COCs at the SL site were found to be within the EPA acceptable risk range for industrial use. Under a hypothetical future residential usage scenario, the risks associated with exposure to the concentrations of several inorganics in groundwater were not within acceptable risk ranges. No significant risk was identified during the Tier I ERA.

3.2.10 Remedial Investigation Phase II

The Phase II RI field work at the SL was intended to further characterize surface soil and confirm groundwater flow direction while also providing data for an ecological characterization. Several surface soil samples were collected for chemical characterization and toxicity testing. Water level data were collected to confirm static water levels and the groundwater flow direction.

The Final RI Report was issued in December 2000. Compounds were reported in soil and groundwater at low levels, generally near the laboratory's instrument detection limits and typically at levels similar to background conditions documented at the former NAS. Thallium was reported in one groundwater sample at a concentration close to the detection limit but was not reported in any other groundwater or soil samples at the site. Thallium was not likely present as a result of site-related activities. Its detection was found to be questionable and more likely attributable to the laboratory analytical method or artifact.

The risk assessment performed at this site concluded that cleanup of environmental media was not warranted to protect human health or the environment from excess risk associated with

exposure to these compounds. As such, an FS was not required and the Navy was able to proceed to the next step under CERCLA.

3.2.11 Proposed Plan

The Navy issued a Proposed Plan for the SL in April 2001. The preferred alternative was for No Action with Groundwater Monitoring. The EPA agreed that under CERCLA, cleanup of soil and groundwater was not necessary based on the results of the Phase II RI and associated risk analyses. The groundwater monitoring component (quarterly monitoring for 1 year) was included to evaluate potential seasonal variability of chemical concentrations in groundwater and, specifically, to confirm the results of the RI with respect to the presence and concentration of thallium.

3.2.12 Record of Decision

The ROD for the SL was signed by the EPA and Navy in March 2002. The ROD specified No Action with groundwater monitoring under CERCLA and required closure of the landfill under provisions of the Massachusetts Solid Waste Regulations.

3.2.13 Post-ROD Activities

In accordance with the ROD, four quarters of groundwater monitoring were completed to confirm the results of the RI with respect to thallium. No thallium was detected in any of the four quarters of sampling. The Navy issued the groundwater monitoring report in October 2002 to supplement the Administrative Record for the SL. Actions to close the landfill were overseen by the MassDEP Office of Solid Waste. The landfill cover system was constructed in summer 2010, consistent with the approved Corrective Action Design. Post-closure long-term monitoring activities consistent with state requirements began in fall 2010 and are on-going.

3.3 Site 4 - Fire Fighting Training Area

IR Program Site 4 comprises approximately 3.8 acres located south of Runway 8-26 and east of Taxiway C, as shown in Figure 3-4. This site consisted of a cracked asphalt pad and concrete containers (burn pits) which were installed in 1988. Fire fighting training operations began at Site 4 in the mid-1950s. NAS South Weymouth personnel indicated that fire fighting exercises were temporarily suspended between 1986 and 1988 as reported in the SI. Prior to 1986, a maximum of 500 gallons per month of waste oil and 1,500 gallons per month of other fuels were placed in old vehicles and burned for firefighting training purposes. In 1988, concrete burn pits were installed to contain jet fuel, and the fire fighting exercises resumed. During training, the containers were partially filled with water and JP-5 fuel was placed on top of the water. The fuel was ignited and then extinguished to provide fire fighting practice. Reportedly,

the only spill or release to the pad would have occurred if water or foam splashed out of the containers during training exercises.

3.3.1 Site Inspection

The Navy conducted geophysical studies as part of the SI, to identify the extent of the FFTA and also collected surface water, sediment, soil, and groundwater samples for TAL/TCL laboratory analyses and reporting. Groundwater was shown to flow from east to west across the site. Elevated levels of metals were not reported in soil at this site. Pesticides/PCBs were not detected in soil; however, trace levels of VOCs and SVOCs were detected. Groundwater samples contained elevated levels of manganese, iron, antimony, cadmium, and silver. Total petroleum hydrocarbons (TPH), oil and grease, and a phthalate were reported in sediment samples from a drainage ditch. Xylene, naphthalene, iron, and lead were detected in surface water samples from the drainage ditch. The ditch discharges to French Stream. The 1988 SI report recommended further evaluation of the FFTA.

3.3.2 Remedial Investigation Phase I

Soil, groundwater, and surface water samples were collected at the FFTA during the Phase I RI in May 1996. No subsurface storage structures (tanks) or debris were observed in test pits or boreholes. Organic compounds (primarily PAHs and pesticides) were detected in shallow soil and sediment samples. Some petroleum-like seeps were observed, but few petroleum-related VOCs were detected in any media. Relatively few organic compounds were detected in groundwater or surface-water samples. Inorganic compounds were detected in all sampled media. Subsurface soil samples were also analyzed for RCRA characteristics; i.e., TCLP, ignitability, reactivity, and corrosivity. No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by COCs at the FFTA site were found to be within the EPA acceptable risk range for industrial use. Under a hypothetical future residential use scenario, the risks associated with exposure to metals were not within acceptable risk ranges. No significant risk was identified in the Tier I ERA due to the lack of ecological receptors.

3.3.3 Remedial Investigation Phase II

A focus of the Phase II RI was to sample locations south of the FFTA adjacent to the east branch of French Stream and the FFTA to ensure it had been adequately characterized. Piezometers were also installed to confirm whether there is a local northeastern groundwater flow component in the area northeast of the site. Several surface soil samples were collected for TAL/TCL and dioxin analysis. Additional subsurface soil samples were also collected.

Monitoring wells were installed in shallow overburden, deep overburden, and bedrock. Several additional surface water and sediment samples were collected. In addition, toxicity testing and tissue sampling were conducted to reduce uncertainty associated with the ERA.

The results of the Phase II RI are summarized as follows: Groundwater flow is generally toward the west. PAHs and pesticides were detected in soil at expected concentrations; however, few fuel/petroleum-related compounds were reported. Aluminum, lead, manganese, and vanadium were reported in surface-water samples at levels exceeding ambient water quality criteria; however, the presence of these metals is not thought to be site-related because elevated levels of these compounds were not reported in site soil. There were no exceedances of human health or ecological risk thresholds for the current and future use scenarios that were evaluated. The Final RI Report was submitted in April 2001.

3.3.4 Proposed Plan

The Navy was in the process of preparing a No Action Proposed Plan when MassDEP requested the excavation and sampling of test pits due to the potential presence of petroleum residuals. The Navy excavated and sampled the test pits in April 2002. Visual results indicated that residual petroleum staining was present immediately below the existing asphalt, but free-flowing petroleum product was not present and the residual petroleum did not appear to be impacting adjacent soil. Analytical results indicated that some petroleum constituents were present in the stained material that had similar properties to petroleum constituents associated with the existing asphalt. Petroleum constituents were not present in the adjacent soil. The EPA and Navy concluded that no further action was warranted to further investigate or respond to the petroleum staining under CERCLA. The Navy issued an Opinion letter from a Massachusetts Licensed Site Professional (LSP) in February 2003 regarding the test pit results. The Navy issued the Proposed Plan for public comment on September 4, 2003. The preferred alternative was no further action under CERCLA.

3.3.5 Record of Decision

In September 2004, the Navy and EPA signed the Final ROD, which specified No Action under CERCLA.

The Navy has addressed the petroleum residuals at the site pursuant to applicable Massachusetts state law. All site activities under the state program were completed in July 2008.

3.3.6 Post-ROD Activities

Additional work was conducted at the FFTA between 2010 and 2012 to determine the presence or absence of perfluorinated compounds (PFCs) in site groundwater and soil and nearby surface water and sediment. PFCs were emerging compounds that the Navy was beginning to assess at historic firefighting training areas. While there are no regulatory standards established for PFCs, EPA has established provisional health advisory levels for PFCs in drinking water. Concentrations of two PFCs, perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) exceeded these provisional levels in some FFTA groundwater monitoring wells. Calculated risk-based values for PFOA and PFOS in soil, surface water, and sediment were not exceeded. Based on the results of the PFC investigation it was determined that a modification to the previous No Action decision was warranted to address potential threats to future use of groundwater for drinking water purposes. An ESD to the ROD was completed in August 2013 in order to modify the No Action decision to include an institutional control to prohibit the use of groundwater. The ESD specified the Navy would develop a LTM plan and implement an annual monitoring program in accordance with the LTM plan in order to monitor and enforce the restrictions on the use of groundwater. The first LUC inspection for this site was conducted in June 2014 by Navy personnel.

The LTM Plan was issued in February 2014 and includes semi-annual sampling for three years, followed by annual sampling for two years. The monitoring data will be evaluated as part of the five-year reviews. The initial five-year monitoring period is considered the minimum timeframe needed to adequately evaluate trends in groundwater, surface water, and sediment data. The sampling frequency will be re-evaluated based on the data collected during the first five-year monitoring period. Furthermore, in the event that concentrations reveal higher than expected concentrations in the initial sample locations, additional downgradient locations will be sampled to define the limits of PFC contamination. LTM sampling events began in the spring of 2014 and continue to be conducted on a semi-annual basis (spring and fall).

3.4 Site 5 - Tile Leach Field

IR Program Site 5 comprises approximately 0.3 acres and is situated in the southwest part of the Base along a drainage ditch as illustrated in Figure 3-5. As presented in the SI, site personnel reported that sanitary waste from former (demolished) Building No. 59¹ (the lighter-

¹ Former Building 59 was also known as Hangar 2, not to be confused with the current Hangar 2 (Building 82). Work completed in 2004 confirmed a connection from the Building 59 sanitary system to the TLF.

than-air dirigible hangar), was discharged to the TLF located south-southwest of the building. Building 59 was used as an anchor pad for dirigibles, and later as the Ground Control Avionics stand. The PA/SI did not identify the specific materials used in the maintenance of the dirigibles; however, it is likely that gasoline, fuels, and lubricants may have been used. The TLF was in active use from 1945 until its closure in 1956. The PA reported that the leach field may have received battery acid wastes, which likely contained lead. No other information exists on the nature or quantity of the liquid material disposed at this site.

3.4.1 Site Inspection

During implementation of the SI, a measurable hydraulic gradient was not observed indicating a flat water table that did not allow for a determination of groundwater flow direction across the site. Groundwater flow at the site is thought to be in a south/southwest direction. Surface water, sediment, groundwater, and soil samples were collected as part of the SI. VOCs were not detected in surface water, sediment, or groundwater. Trace to low levels of VOCs were detected in soil samples. Aluminum, iron, and manganese were detected in groundwater at levels exceeding regulatory standards. Aldrin was detected in both upstream and downstream sediment samples. The SI stated that the analytical data did not indicate that the TLF was a disposal site. The recommended action included supplementary SI work to analyze media for nitrates that might be associated with the leach field.

3.4.2 Remedial Investigation Phase I

Soil, groundwater, and sediment samples were collected during the Phase I RI in May 1996. The Phase I RI confirmed the location of the leach field and identified the orientation of the abandoned distribution lines. Trace concentrations of organic compounds (PAHs and pesticides) were detected in shallow soil samples. Relatively few organic compounds were detected in groundwater and surface water samples. Inorganic compounds were detected in all sampled media. Subsurface soil samples were also analyzed for RCRA characteristics; i.e., TCLP, ignitability, reactivity, and corrosivity. No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by COCs at the TLF site were found to be within the EPA acceptable risk range for industrial usage. Under a hypothetical future residential usage scenario, the risks associated with exposure to the concentrations of inorganics in groundwater were not within acceptable risk ranges. The ERA results indicated that there was no significant risk associated with the site COCs.

3.4.3 Remedial Investigation Phase II

The Phase II RI for the TLF focused on the downgradient sampling locations to the southwest of the site. The RI further investigated subsurface soil, groundwater, surface water, sediment, and ecological conditions. Soil borings were installed to collect soil samples. Additional monitoring wells were installed in shallow overburden, deep overburden, and competent bedrock. Groundwater samples were analyzed for VOCs, including 1,4-dioxane, as well as other parameters. Three additional surface water/sediment locations were proposed for further characterization. Also, toxicity testing and a benthic macro-invertebrate community survey in French Stream were planned to support the Tier II ERA.

The results of the Phase II RI are summarized as follows: The leach field is composed of a sand bed. Groundwater flow is toward the southwest. Very few compounds, with the exception of some PAHs, were detected in site media at levels above background levels established for former NAS South Weymouth. The risk analyses indicated no exceedances of human health risk thresholds for all exposure scenarios that were assessed (current and future use). There were no exceedances of ecological risk thresholds for the receptors that were assessed. The Final RI Report was submitted in May 2002.

3.4.4 Proposed Plan

A draft final No Action Proposed Plan was submitted in October 2002. In response to comments from the regulators on the Proposed Plan, the Navy completed a focused groundwater investigation in April 2005 to address concerns with the 1,4-dioxane results reported in the RI. The Navy issued the Final Proposed Plan in October 2005. The preferred remedy was No Action.

3.4.5 Record of Decision

The Navy and EPA signed the Final ROD in May 2006 that specified No Action under CERCLA. MassDEP provided a letter of concurrence dated April 27, 2006.

3.5 Site 6 - Fuel Farm

Site 6, the Fuel Farm, was removed from the IR Program in 1994 because only virgin petroleum products were being addressed. The site has been addressed under the Navy's UST Program and as a petroleum site in a manner consistent with provisions of the MCP.

3.6 Site 7 - Sewage Treatment Plant

IR Program Site 7 comprises approximately 3.2 acres and is located in the northern portion of former NAS South Weymouth as shown in Figure 3-6. The site includes the former STP itself, an adjacent former Tile Bed Area (leaching field), and some of the adjacent wetland area.

The Tile Bed Area (0.9 acres) was installed in the 1940s as part of a wastewater treatment system during the original construction of the Base. The original wastewater treatment plant was constructed near Hangar 1 (referred to as the Sewage Lift Station, Building 7) and was the subject of assessment under the EBS program. The former plant consisted of primary settling and chlorination tanks. From the 1940s to sometime prior to 1953, treated wastewater from Building 7 was pumped to the Tile Bed Area for final treatment (filtration, biodegradation) and disposal.

In 1953, the Navy constructed the STP adjacent (north) to the Tile Bed Area. Use of the Tile Bed Area was discontinued and the STP was used as the wastewater treatment facility for the Base from 1953 to 1978. The wastewater treated by the plant was primarily comprised of wash water from drains, restrooms, and sanitary sewer inlets. The original construction of the STP included a primary settling basin and a trickling filter. The treated wastewater discharge was directed to an outfall located along the northwest corner of the STP, which eventually discharged to French Stream. During the plant's 25-year operation, a number of upgrades were completed, including the expansion of the secondary treatment system (trickling filter and secondary settling tank) and the installation of a simple aerobic digestion system and drying beds to treat the wastewater sludge.

NAS South Weymouth obtained a National Pollutant Discharge Elimination System (NPDES) permit in 1975, which required quarterly testing of French Stream by an independent, State-certified laboratory. The drainage ditches that connected the STP to French Stream were also tested. The permit was obtained in response to regulations promulgated under the Clean Water Act of 1972. Permits were issued by the Massachusetts District Commission until 1975, when the Massachusetts Water Resources Authority (MWRA) was formed. NPDES quarterly testing results and information regarding the types of COCs that may have been disposed through the sewage system were not available for the 1999 SI. Results from the past 18 sampling events were in compliance with the permit requirements; records are available at the former NAS South Weymouth Caretaker Site Office.

In 1978, the STP was dismantled and wastewater from the Base was connected to the Town of Weymouth municipal sanitary sewer system. A site inspection on January 29, 1991 confirmed that the tanks had been thoroughly cleaned. The Navy removed and/or demolished most of the STP structures to approximately 2 feet below ground surface by 1992.

3.6.1 Site Inspection

No field sampling was conducted as part of the SI.

3.6.2 Remedial Investigation Phase I

Soil, groundwater, surface water, and sediment samples were collected at the STP during the Phase I RI in May 1996. Organic compounds (PAHs and pesticides) were detected in surface soil and sediment samples. Relatively few organic compounds were detected in subsurface soil, groundwater, and surface water samples. Inorganics were detected in all sampled media.

Risks to human health posed by COCs at the STP site were within the EPA acceptable risk range for industrial use. Under a hypothetical future residential use scenario, there was no significant risk associated with the COCs in surface soil; however, the risks associated with concentrations of inorganics in groundwater and PCBs in surface water were not within acceptable risk ranges. Additional risk assessment was recommended for surface water and sediment.

3.6.3 Remedial Investigation Phase II

The Phase II RI included further investigation of surface soil, subsurface soil, groundwater, surface water and sediment, and ecological conditions at the STP. Borings and new wells were installed in shallow overburden, deep overburden, and competent bedrock. The investigation also included surface water and sediment sampling, tissue sampling, and toxicity testing to support the ERA.

The results of the Phase II RI are summarized as follows: The Tile Bed Area comprises a 4-foot thick, constructed gravel layer under a vegetated surface. Groundwater generally flows toward the southwest. Very few compounds were detected in samples at levels in excess of background conditions. Those included pesticides (dichlorodiphenyltrichloroethane [DDT] and dieldrin) in surface soil and sediment, and inorganics (arsenic and chromium) in surface soil and groundwater. There were no exceedances of human health risk thresholds for current site use. Human health risk thresholds for future site use scenarios (residential and recreational) were exceeded due to concentrations of dieldrin in surface soil, arsenic in groundwater, and/or PCB in surface water. Ecological risk thresholds were exceeded, primarily because of DDT, DDD, DDE, and arsenic in sediment (hydric soil). The Final RI Report was submitted in April 2002.

3.6.4 Feasibility Study

The Navy issued the draft final FS to address risks in surface soil and sediment (hydric soil) in December 2002. During review of the draft final FS, the lack of soils data from the former sludge drying bed area was identified as a data gap. Navy completed a sampling event in March 2006 to supplement the soil and groundwater data collected during the Phase II RI for use in finalizing the FS. The 2006 results indicated that soil concentrations at the former sludge drying bed were generally consistent with those found in other areas of the site.

The Final FS, Revision 1 was issued in April 2007. Remedial action objectives identified in the FS include:

- eliminate potential human and ecological receptor exposure to COCs present in Site soil at concentrations above the selected preliminary remediation goals (PRGs); and
- eliminate potential human and ecological receptor exposure to COCs present in Site sediment at concentrations above the selected PRGs.

Four remedial alternatives were developed:

- Alternative 1: No Action;
- Alternative 2: In-Situ Bioremediation and Phytoremediation;
- Alternative 3: Excavation and Off-Site Disposal or Recycling (Asphalt Batching); and
- Alternative 4: Excavation and Ex-Situ Solvent Extraction.

3.6.5 Proposed Plan

Navy issued the Proposed Plan for the STP in August 2007. The preferred alternative included excavation of contaminated surface soil and sediment and off-site disposal or recycling by asphalt batching.

3.6.6 Record of Decision

The ROD was signed by the Navy on April 7, 2008 and the EPA on April 20, 2008. MassDEP issued a letter of concurrence dated April 17, 2008.

3.6.7 Post-ROD Activities

A PDI was completed in March 2009 followed by the RD/RA Work Plan. Remedial action activities consistent with the ROD and RD/RA Work Plan commenced in July 2009, but were suspended in November 2009, when additional contamination was discovered. An ESD was completed in 2010 to modify the STP remedy from off-site disposal of the excavated soils and sediment to beneficial reuse as subgrade layer materials for the WGL landfill cover system. The remedial goals were achieved in many areas of the site; however, volume limits were exceeded and petroleum was found at depth. Additional soil sampling to address apparent petroleum contamination in an upland area of the STP site (remediation area A-2) was conducted in 2011.

A final supplemental PDI Project Report was issued in September 2012. The analytical results indicated that the contamination was not strictly petroleum-related. The report documented

contamination beyond the previously defined excavation boundary for Area A-2. A risk-screening evaluation further characterized the potential threat to human health from exposure to site soils and identified COCs for hypothetical residents, industrial workers, and adolescent trespasser exposure scenarios. Since the COCs, media, and exposure scenarios are different from those in the ROD, site-specific PRGs were calculated for all COCs based on the new exposure scenarios for surface soil, subsurface soil, and headwall soil. Due to potential health impacts for a hypothetical resident or industrial worker, additional CERCLA actions have been recommended. An additional soil delineation investigation was initiated in July 2013 with the following three objectives: (1) to further delineate the lateral extent of soil contamination around former borings SB-14, SB-15A, and SB-20A (2) determine whether the previously remediated drainage channel has been impacted by drainage from the headwall pipes and (3) close the data gap associated with the extent of the surface soil contamination around A2-B-02, previously identified during the 2009 RA. An Additional Soil Delineation Investigation report with the findings of the additional soil delineation investigation was issued in February 2014. The Navy is currently implementing additional remedial action that includes excavation of impacted surface soil, unsaturated subsurface soil, structures, piping, and sediment. The scope of the remedial action was detailed in the Final Addendum to Remedial Action Work Plan, Soil Excavation at Site 7 Former STP Location (TetraTech EC [TtEC], July 2014).

During the removal of stone and sediment from the North Trickling Filter in January 2015, a small amount of mercury (droplets) was discovered. A mercury response plan was drafted and implemented. Mercury droplets (< 1 tablespoon) were recovered using a mercury vacuum and containerized in an 8-ounce jar, and mercury-contaminated soil and filter media were removed and containerized in two drums. A specialty hazardous material subcontractor performed mercury decontamination activities of potentially impacted media. A confirmatory soil sample was collected for mercury analysis, which did not indicate elevated levels. Mercury-contaminated media was disposed at Veolia ES Technical Solutions LLC in Port Washington, Wisconsin. No mercury-impacted media was found during removal of the stone and sediment associated with the South Trickling Filter.

A ROD Amendment will be prepared to document changes to the site remedy. Once all remedial activities have been completed, post-remediation monitoring will be performed.

3.7 Site 8 - Abandoned Bladder Tank Fuel Storage Area

IR Program Site 8 comprises approximately 0.46 acres northwest of Building No. 82 (Hangar 2) as shown in Figure 3-7. The site was used for the temporary storage of JP-5, a type of aviation gasoline, from approximately 1982/1983 to 1987. The fuel was stored in four

10,000-gallon fabric bladders (tanks) contained within an earthen berm. The tanks were used to support refueling operations for active aircraft.

3.7.1 Site Inspection

Soil, surface water, sediment, and groundwater samples were collected and analyzed for TAL/TCL parameters as part of the SI. The SI reported low concentrations of inorganics, and that PCBs, pesticides, oil and grease, and TPH were not detected in soil samples. Several VOCs and SVOCs were reported at low levels in soil. Inorganics and one SVOC were reported in groundwater samples, but not above federal Maximum Contaminant Levels (MCLs). Inorganics were reported in surface water and sediment samples. Aldrin, acetone, trace TPH, and SVOCs, including PAHs, were reported in sediment samples. The SI recommended further investigation of the ABTFSA.

3.7.2 Remedial Investigation Phase I

Soil, groundwater, and sediment samples were collected during the Phase I RI in May 1996. Trace concentrations of organic compounds (PAHs and pesticides) were detected in surface soil and sediment samples. Relatively few organic compounds were detected in subsurface soil, groundwater, and surface water samples. Inorganic compounds were detected in all sampled media. Subsurface soil samples were also analyzed for RCRA characteristics; i.e., TCLP, ignitability, reactivity, and corrosivity. No subsurface soil samples exhibited chemical characteristics that would cause them to be classified as a RCRA-hazardous waste.

Risks to human health posed by COCs at the ABTFSA site were found to be within the EPA acceptable risk range for industrial and residential use. No significant risk was identified from COCs in surface soil for the ERA. The Phase I RI recommended further risk assessment for surface water and sediment.

3.7.3 Remedial Investigation Phase II

The Phase II field investigations focused on the groundwater flow direction and further characterization of surface soil, subsurface soil, groundwater, surface water and sediment, and ecological conditions. The investigation included collection of surface soil samples; installation of soil borings; construction of additional monitoring wells screened in shallow overburden, deep overburden, and competent bedrock; collection of additional surface water and sediment samples; and toxicity testing to support the ERA.

The results of the Phase II RI are summarized as follows: The groundwater flow is generally to south, with both southwesterly and southeasterly components at different times of the year. Very few compounds were reported in excess of background conditions (these were primarily

PAHs). No unacceptable human health risks were identified except for a slight risk to hypothetical future residents consuming aluminum and manganese from site groundwater. However, the presence of aluminum and manganese in groundwater is consistent with regional conditions, and calculated risks do not exceed risks associated with background concentrations. No significant ecological risks were identified at the site. The sampling results were generally consistent with background levels. There is no documentation or evidence from the investigations of any past fuel releases at the site. The RI report was finalized in March 2002.

3.7.4 Proposed Plan

The Navy issued a final No Action Proposed Plan in October 2002. The EPA, MassDEP, and the public agreed with the Proposed Plan.

3.7.5 Record of Decision

The Navy and EPA signed the final No Action ROD in May 2003. MassDEP provided a letter of concurrence with the No Action decision, dated March 21, 2003.

3.8 Site 9 - Building 81

IR Program Site 9, Building 81, was the Naval Station's Marine Air Reserve Training and former vehicle maintenance area. The foundation of the former garage is located in the central building area of the Base as shown in Figure 3-8. The Building 81 site initially contained a 500-gallon UST for the storage of waste oil. The UST, associated piping, and a small quantity of surrounding soil (estimated at less than 30 cubic yards) were removed in 1991.

The site was originally investigated under the MCP program after Release Tracking Number (RTN) 3-10628 and RTN 3-11622 were assigned to the site due to releases from the former UST. A series of assessment activities were performed to investigate evidence of a release from the UST. In 1994, approximately 170 cubic yards of soil were excavated from the vicinity of the UST. After light non-aqueous phase liquid (LNAPL) was detected in a monitoring well, an additional 500 cubic yards of soil were removed from the area in 1998. According to post-excavation documentation provided under the MCP program, the LNAPL and associated petroleum-impacted soil were successfully removed. However, in addition to petroleum-related compounds, chlorinated VOCs were detected in groundwater at the site at concentrations of up to 1 part per million (ppm).

In 2000-2001, the Navy conducted a pilot study using ISCO under the context of the MCP, which at the time was an innovative technology to address groundwater impacts. The pilot study, using Fenton's reagent (a chemical solution using hydrogen peroxide) to reduce concentrations of chlorinated VOCs in groundwater, was started in the fall of 2000. The results

from the 60-day post-treatment sampling showed significant contaminant concentration rebound in the central area of the plume. An additional polishing step (re-injection of Fenton's reagent) was completed in late March and early April 2001. The results of 45-day and 100-day sampling showed significant rebounding in 6 to 8 wells along the axis of the plume. A remediation performance report for the ISCO work was prepared in March 2002.

3.8.1 Remedial Investigation

Once the ISCO pilot test was complete, the site was moved to the CERCLA program as IR Site 9. The CERCLA petroleum exclusion policy was no longer applicable to the site due the continued presence of chlorinated VOCs in the groundwater. Under the IR Program, the Navy used the ISCO results, combined with the analytical data compiled from the MCP program investigations, to characterize the Building 81 site and to develop an RI Work Plan. The final RI Work Plan was submitted in June 2003. The regulators did not accept the June 2003 RI Work Plan as a final document. The Navy significantly revised the document and issued the Final RI Work Plan in October 2006. The RI field activities commenced in June 2006 and were completed in December 2006. The draft RI Report was issued in May 2008.

The RI Report assessed contamination in soil and groundwater at the Site. The predominant contaminants present are VOCs in groundwater. The overall groundwater flow direction at the Site is generally toward the west-southwest. The draft RI Report documented no human health risks from contaminants in soil but identified potential unacceptable risks for future residents from use of groundwater as drinking water and for future construction workers from inhalation of volatile contaminants in trench air.

In response to comments on the draft RI report, a supplemental RI investigation work plan was developed in 2009. The supplemental field program was completed in early 2010; the draft final RI report was issued in December 2010. The final RI report was issued in October 2011.

3.8.2 Feasibility Study

The Navy issued the Final FS in April 2013 to address risks in groundwater. Remedial action objectives identified in the FS include:

- Prevent the migration of COC-impacted groundwater at concentrations that pose unacceptable risk.
- Prevent exposure of construction workers to COCs at concentrations that pose unacceptable risk.

-
- Prevent exposure of potential building occupants to VOCs resulting from vapor intrusion into any future buildings on the Site at concentrations that pose unacceptable risk.
 - Prevent human exposure to COCs in groundwater at concentrations that pose unacceptable risk.

Four remedial alternatives were developed:

- (G-1) No Action;
- (G-2) Bio-barriers, MNA, and LUCs;
- (G-3) Enhanced In-Situ Bioremediation, Bio-barriers, MNA, and LUCs; and
- (G-4) ISCO, Bio-barriers, MNA, and LUCs.

3.8.3 Proposed Plan

Navy issued the Proposed Plan for Building 81 in October 2013, and the public hearing was held October 22, 2013. The preferred alternative includes In-situ (Overburden and Bedrock Source Area) Enhanced Bioremediation, a Bio-Barrier, MNA, permanent and interim LUCs, and Five-year reviews (as needed).

3.8.4 Record of Decision

The ROD was signed by the Navy on September 17, 2014 and the EPA on September 30, 2014. MassDEP issued a letter of concurrence dated September 4, 2014.

3.8.5 Post-ROD Activities

A LUCIP will be prepared outlining the implementation of LUCs to control exposure to COCs in groundwater until the Remedial Goals (RGs) are achieved. Interim LUCs will be established to control exposure to COCs in groundwater until unacceptable risks are eliminated. Permanent LUCs will be implemented to: prohibit installation of groundwater production, supply, and irrigation wells within the permanent LUC compliance boundary at the Building 81 Site (e.g, Recreation Zoning District [RecD] and Village Center Zoning District [VCD] zoning districts); and prohibit future residential uses within the RecD zoning district at the Site.

The interim LUCs listed below will be implemented in the RecD portion of the Site to prevent unacceptable risk from vapor intrusion and exposure to vapors in construction trenches until the cleanup levels are achieved.

-
- A LUC restricting the type and nature of construction permitted in the source area of the plume where the highest VOCs concentrations have been detected and where active remediation might be conducted (as a contingency), until cleanup levels are achieved. Construction in the vicinity of the bio-barriers will also be restricted to prevent disturbance of and damage to the injection wells and allow future injections.
 - A LUC requiring prior Navy, EPA, and MassDEP approval of construction dewatering plans before excavation activities could be conducted, until the cleanup levels are met.
 - A LUC specifying health and safety procedures to be used by construction workers to prevent unacceptable exposure risks until the cleanup levels are met.
 - A LUC specifying passive ventilation design and building construction methods, such as a subslab vapor migration system, to prevent exposure of building occupants to vapor intrusion from VOCs in groundwater at levels that pose an unacceptable risk, until cleanup levels are achieved.

The Navy is developing a remedial design for the groundwater remedy. In accordance with the ROD, an enhanced bioremediation implementation will be performed on PCE overburden, shallow bedrock and deep bedrock treatment zones at Building 81. In addition, two bio-barriers will be installed to intercept and treat the contaminant plume at its leading edge, one in the overburden and one in the bedrock.

Prior to the actual injections, groundwater samples were collected to establish a new baseline level of contamination and a utility and preferential flow investigation will be conducted to evaluate the effect of utilities on contaminant migration.

3.9 Site 10 - Building 82, Hangar 2

IR Program Site 10 is located in the central building area of the Base as shown on Figure 3-9. A removal action was conducted at this site in September 1998 as part of Base closure activities. The removal action included emptying and cleaning the floor drain systems and gas trap manholes, and disassembling, cleaning, and removing the oil-water separator (OWS). All outlets to and from the OWS and gas trap manholes, including connections to the storm water system, were plugged with brick and hydraulic cement. One borehole was advanced in November 1998 adjacent to each of the four gas trap manholes and the OWS vault. Site 10 became the subject of environmental investigation in December 1998, when petroleum related compounds were detected in the vicinity of one of the gas trap manholes in excess of MCP Reportable Concentrations for S-1 soils. Upon notification, the MassDEP assigned RTN 3-18110 to the site.

Additional investigations were conducted under the MCP program, including a Phase I Initial SI and a subsequent removal action in 2001. Soil and groundwater samples collected during the SI identified the floor drain system as a possible source of contamination. The Navy then removed the four floor drain systems to the extent possible, without removing piping from below weight-bearing structures. Once the floor drain systems were removed, the soils beneath the floor drains were sampled.

Since other parcels within the former NAS South Weymouth property were already undergoing environmental activities under the federal Superfund program, the EPA and MassDEP directed the Navy to cease activities under the MCP program and continue activities under the Superfund program. The detection of chlorinated solvents (1,1,1-trichloroethane) at Building 82 made the CERCLA petroleum exclusion policy no longer applicable to the site. Areas within the Building 82 footprint and concrete apron which were previously evaluated under the EBS (RIAs 30A and 107) were also incorporated into IR Site 10.

3.9.1 Remedial Investigation

In 2003, the Navy performed a limited due diligence assessment in order to provide preliminary environmental data to the contractor for the master developer of the former NAS property. Work conducted included seismic refraction work outside the building; two levels each of ground-penetrating radar and terrain ground conductivity; subsurface soil samples under and outside of the hangar; and the installation and sampling of eight monitoring wells.

The Navy submitted a final RI Work Plan in November 2003. The regulators did not accept the November 2003 RI Work Plan as a final document. The Navy significantly revised the document and issued the Final RI Work Plan in October 2006. The RI field activities commenced in June 2006 and were completed in December 2006. In response to regulatory comments on the draft RI Report, an RI Work Plan Addendum was developed. Additional field investigation activities were completed in May 2009, including collection of groundwater samples for VOC analysis. The final RI report was issued in February 2010.

The Building 82 RI Report assessed contamination in soil, groundwater, surface water, and sediment. The RI Report concluded that generally low concentrations of VOCs, SVOCs, pesticides, PCBs, and metals were detected in site soil, groundwater, surface water, and sediment. The RI determined that localized overburden groundwater flow is influenced by the two 42-inch storm sewers that bisect the site. A human health risk assessment evaluated potential risks from contaminants in soil, groundwater, drainage ditch sediment, and surface water at the Building 82 Site. The RI Report documented potential unacceptable risks for future residents primarily from use of groundwater as drinking water, and for future construction

workers from inhalation of dust and inhalation of volatile contaminants in trench air. Ecological risks to terrestrial plants and invertebrates, sediment invertebrates, aquatic organisms, and terrestrial receptors at the Site were evaluated and were determined to not warrant further evaluation.

After the final RI report was issued, and in conjunction with preparation of the FS, additional delineation of the groundwater contaminant plume was conducted. The additional groundwater profiling focused on the area with elevated trichloroethylene (TCE) concentrations to the south and southeast of the Site. An RI Addendum issued in July 2010 documented the larger TCE plume; there was no change to the risk assessments. Following a comprehensive water level measurement round, the final RI Addendum was issued in July 2011. In October 2010 Navy completed a maintenance action separate from the RI to remove additional drainage piping, manholes, and some impacted soil near the new access road. The final maintenance action report was issued in July 2011.

3.9.2 Feasibility Study

The Navy issued the Final FS in July 2012 to address risks in groundwater. Remedial action objectives identified in the FS include:

- Prevent human exposure to groundwater containing concentrations of contaminants in excess of the remedial goals and that cause unacceptable risk.
- Prevent or minimize further migration of contaminants in groundwater.
- Restore groundwater quality such that there are no risks to human health preventing its permissible beneficial use.

Five remedial alternatives were developed:

- (G-1) No Action;
- (G-2) Chemical Oxidation, MNA and LUCs;
- (G-2A) Chemical Oxidation, LUCs and Monitoring;
- (G-3) In-situ Enhanced Bioremediation, MNA; and
- (G-4) LUCs; and MNA and LUCs.

3.9.3 Proposed Plan

Navy issued the Proposed Plan for Building 82 in August 2012, and the public hearing was held August 9, 2012. The preferred alternative includes chemical oxidation, LUCs, monitoring, and Five-Year Reviews (as needed).

3.9.4 Record of Decision

The ROD was signed by the Navy and the EPA in September 2012. MassDEP issued a letter of concurrence dated September 27, 2012. The selected remedy for the Building 82 Site is Alternative G-2A; chemical oxidation, LUCs, monitoring, and five-year reviews (as needed).

3.9.5 Post-ROD Activities

A LUCIP is to be completed and implemented for Building 82 in accordance with the ROD. The LUCIP will outline the implementation of LUCs on an interim basis to prohibit the installation of groundwater extraction wells for production, supply, or irrigation at the Site. The LUCIP will also require any construction dewatering activities at the Site to be approved by the Navy, EPA, and MassDEP prior to excavation/construction activities. The final LUCIP will be issued in 2015 .

A Pilot Test Work Plan for ISCO pilot-scale study required by the ROD was finalized in Spring 2014. The pilot study injections were completed in April 2014 in a treatment zone encompassing the center of the mapped plume, based on pre-injection groundwater samples collected in February 2014. Groundwater concentrations in the plume have been monitored in June, August, and October 2014 and March 2015. Additional monitoring is planned for 2015 to further evaluate the efficacy of ISCO injections in reducing TCE concentrations in the plume.

3.10 Site 11 - Solvent Release Area

The Solvent Release Area (SRA) is located in the northeast portion of the Base as shown in Figure 3-10. As part of the Phase II EBS, subsurface soil sample BG-05, intended to assess background soil conditions, was collected in the area. A trace level of tetrachloroethene (PCE) (below regulatory standards) was detected in the soil sample. It was determined through conversations with Navy personnel that Navy reservists used this area of the Base to conduct weekend field activities. Based on the potential that gun cleaning or other activities may have occurred, the area was added to Phase II EBS program and was designated as RIA 108. Additional samples were collected to confirm that the PCE result was valid. The Navy subsequently sampled a downgradient well at the former Pistol Range and found PCE concentrations exceeding screening criteria.

3.10.1 Remedial Investigation

In the late fall of 2003, the Navy conducted a field screening study using a Geoprobe; based on those results, seven monitoring wells were installed in early 2004. Preliminary results from those wells confirmed the presence of chlorinated solvents, primarily PCE, in the groundwater, with the most elevated concentrations near the original BG-05 location. In the fall of 2004, the Navy conducted a geophysical investigation and source delineation. Based on the available information, the Navy determined that further investigation under CERCLA was necessary and the site was therefore moved to the IR Program as Site 11 and identified as the SRA. The Navy developed an RI Work Plan for the SRA under the IR Program in accordance with CERCLA. The Navy issued the Final RI Work Plan in October 2006. The RI field activities commenced in May 2006 and were completed in January 2007. The draft RI Report was issued in September 2008. In response to regulatory comments on the draft RI Report, an RI Work Plan Addendum was developed in 2009. The additional field investigation activities were completed in 2009. The results of the supplemental field investigation were incorporated into the RI Report. The final RI Report was issued in August 2010.

The SRA RI Report assessed contamination in soil, groundwater, surface water, and sediment. The RI Report concluded that VOCs and five metals were the predominant contaminants at the SRA and that in general SVOCs, pesticides, and PCBs were detected infrequently in site soil, groundwater, surface water, and sediment. A human health risk assessment evaluated potential risks from contaminants in soil, groundwater, drainage ditch sediment, and surface water at the SRA. The RI Report concluded that there are no unacceptable human health risks under current exposure scenarios. However, potential unacceptable risks were identified for future residents, primarily from use of groundwater as drinking water, and for future construction workers from ingestion, dermal contact, and inhalation of volatile organic contaminants in trench air and exposure to elevated concentrations of vanadium in dust. The RI Report concluded that ecological risks to terrestrial plants and invertebrates, aquatic organisms, and terrestrial receptors at the Site do not warrant further evaluation. Some slight impacts to sediment invertebrates were identified but are limited in extent.

3.10.2 Feasibility Study

An FS was completed to develop and evaluate potential remedial alternatives to address the potential unacceptable risks identified in the HHRA in the SRA RI Report. The Final FS was issued in December 2012. To support the FS decision-making process, the Navy performed additional groundwater sampling: two additional groundwater sampling rounds were completed in spring and fall of 2011 at key locations at the fringe of the PCE plume.

Remedial action objectives identified in the FS include:

- Prevent the migration of COCs to surface water at concentrations that pose an unacceptable risk to human health.
- Prevent exposure of building occupants to VOCs resulting from vapor intrusion into future buildings at the Site at concentrations that pose unacceptable risk.
- Prevent exposure of construction workers during excavation activities to VOCs and COCs in groundwater at concentrations that pose unacceptable risk.
- Prevent migration of groundwater containing COCs at concentrations that pose unacceptable risk.

Six remedial alternatives were developed:

- (G-1) No Action;
- (G-2) Monitoring, Engineering Controls, and LUCs;
- (G-3) Overburden PRB, Monitoring, Engineering Controls, and LUCs;
- (G-4) Two Overburden PRBs, Monitoring, Engineering Controls, and LUCs;
- (G-5) Overburden and Bedrock Source Zones Enhanced Bioremediation, One Overburden PRB, Monitoring, Engineering Controls, and LUCs; and
- (G-5A) Overburden and Bedrock Source Zones Enhanced Bioremediation, Two Overburden PRBs, Monitoring, Engineering Controls, and LUCs.

3.10.3 Proposed Plan

The Navy issued the Proposed Plan for the SRA in February 2013, and the public hearing was held February 27, 2013. The preferred alternative included remedial Alternative G-5A: overburden and bedrock source zone enhanced bioremediation, two overburden PRBs, monitoring, engineering controls, and LUCs.

3.10.4 Record of Decision

The ROD was signed by the Navy and EPA in September 2013. MassDEP issued a letter of concurrence dated September 30, 2013. The selected remedy for the SRA Site is Alternative G-5A; overburden and bedrock source area enhanced bioremediation, two overburden mulch PRBs, engineering controls, LTM, LUCs, and five-year reviews (as needed).

3.10.5 Post-ROD Activities

A LUCIP is expected to be completed in 2015 and implemented for the SRA in accordance with the ROD. The LUCIP will outline the implementation of LUCs to control exposure to COCs in groundwater until the RGs are achieved. A permanent LUC will be implemented to prohibit installation of groundwater production, supply, and irrigation wells at the SRA Site. A second permanent LUC will be implemented to prohibit residential use at the SRA Site. The following additional LUCs will be implemented on an interim basis, north of the East Mat Ditch (EMD), until RGs are met:

- A LUC requiring prior EPA and MassDEP approval of construction dewatering plans before excavation activities could be conducted.
- A LUC specifying health and safety procedures to be used by construction workers to prevent unacceptable exposure risks.
- A LUC requiring approval of plans for recreational buildings to prevent exposure of building occupants to site vapor in indoor air.

The Navy is developing a scope of work for the remedial design for the groundwater remedy. In accordance with the ROD, an enhanced bioremediation pilot-scale study and enhanced bioremediation implementation will be performed on the PCE Plume at the SRA. The Phase 1 Source Area Remedial Action will focus on a treatment zone encompassing the center of the mapped overburden plume and the entire bedrock plume. The Phase 2 Source Area Remedial Action will encompass the remainder of the plume exceeding the RGs. In addition, two PRB walls will be installed in the overburden: one north of and near the EMD to intercept and treat the overburden PCE plume at its leading edge and one at the upgradient edge of the upland north of the EMD to treat the PCE plume entering the upland area.

Installation of the monitoring wells and injections wells necessary to conduct the Phase 1 Source Area Remedial Action was completed in April 2014. Groundwater samples were collected in March and April 2015 to establish a new baseline level of contamination prior to conducting bioremediation injections, which are scheduled for Summer 2015.

3.11 Area of Concern - Hangar 1 (OU25)

Hangar 1 is located at the intersection of Shea Memorial Drive and Cummings Road. The new Bill Delahunt Parkway runs through the southeastern portion of the Hangar 1 site. Hangar 1 was built in 1966 on the site of a former World War II-era dirigible hangar originally constructed in 1942. The primary use of Hangar 1 was for storage and maintenance of aircraft, including

activities such as metal working, engine work, painting, arming, washing, hydraulic system repair, welding, parachute packing, photo development, training, and plating and anodizing.

Aqueous film forming foam (AFFF) was stored in Hangar 1 (North Lean-To) in two above-ground storage tanks (ASTs) as shown on Figure 3-11. Releases of AFFF occurred in the area of the AFFF ASTs, the pump room, and the AFFF distribution system. AFFF was also stored in 55-gallon drums in the Crash Truck Garage in the South Lean-To, attached to Hangar 1.

Hangar 1 was initially investigated along with the floor drainage system located within the hangar. Subsequent to completion of the NFA ROD in 2010 and the commencement of the PFC investigation, the site was divided into two parcels, the Hangar 1 Aquifer Protection District (APD) parcel and the Hangar 1 Non-APD parcel.

The ROD for Hangar 1 specified a NFA decision for soils and groundwater based on the Navy's investigations and removal actions at the site. The streamlined human health risk assessment performed at the completion of the removal actions concluded that exposure to the soils and groundwater at the site did not pose an unacceptable risk to human health or the environment.

In 2010, the EPA and the MassDEP requested that additional environmental data be collected to investigate the potential presence of PFCs in groundwater. PFCs are components of AFFF, which was used, released, and/or spilled in areas of NAS South Weymouth, specifically in and around Hangar 1. PFCs are stable and bioaccumulative compounds classified by the DOD as emerging contaminants. Two PFCs, PFOS and PFOA, are considered marker compounds that serve to indicate the presence of other PFCs. PFOS and PFOA are the only PFCs with EPA PHA values available for comparison.

The division of Hangar 1 into two separate parcels was conceptualized as a means to facilitate land transfer discussions between the Navy, EPA, MassDEP, the local reuse authority, and their master developer. An ESD with public comment signed by Navy and EPA was issued for Hangar 1 to address the presence of PFOS and PFOA in groundwater outside of the APD at concentrations exceeding the Provisional Health Advisory (PHA). The ESD added an institutional control remedy and a deed restriction was placed on the property prohibiting the use of groundwater as a source of drinking water in a 22-acre area of Hangar 1 (outside the APD) as presented in Figure 3-11. This remedy was protective of human health and the environment and the 22-acre parcel was determined to be suitable to transfer. The portion of Hangar 1 area within the APD was not part of the ESD and will be the subject of a future decision document.

3.11.1 Phase II Environmental Baseline Survey

During 2010-2011, a *Phase II Environmental Baseline Survey* was conducted to assess the presence/absence of PFOS and PFOA at NAS South Weymouth, specifically at Hangar 1. PFOS and PFOA were detected above PHA values at four of the six wells sampled at Hangar 1 during the 2011 groundwater sampling event. The highest concentrations of PFOS and PFOA were identified near Hangar 1 and decreased downgradient of the hangar. This spatial distribution pattern is consistent with Hangar 1 being a source of these chemicals in groundwater. Soil borings were advanced adjacent to groundwater sample locations and at target locations associated with the AFFF ASTs, AFFF distribution system, floor drain system, two former exterior oil-water separator locations, and the former Crash Truck Garage. The highest concentrations of PFOS and PFOA were detected in the vicinity of the former Crash Truck Garage (South Lean-To) and the former AFFF ASTs (North Lean-To) just above the water table. Based on the current land use, there are no identified human or ecological receptors potentially impacted by the presence of PFOS and PFOA in soil or in groundwater. However, future use of the site may include development at or near Hangar 1.

3.11.2 Remedial Investigation

A Draft Final Remedial Investigation Work Plan was submitted August 2015. Navy intends to implement the Work Plan in Fall 2015.

4.0 SCHEDULE DEVELOPMENT

The schedules included in this document were developed using the current status of activity for each site at former NAS South Weymouth, anticipated activities, and projected funding availability. The due dates are based on durations of project activities that were developed in consultation with the BCT. The deliverables required during the remedial process are separated into two categories: primary and secondary. The Navy has proposed accelerated schedules in some cases. The following milestone and deliverables schedules are provided in Appendix A:

- AOCS: IOA and Hangar 1;
- EBS RIAs: Old Hangar 2;
- Post-Rod Activities: Building 81, Building 82, SRA, and STP;
- LTM Activities: WGL, RDA, SL, and FFTA; and
- LUC Inspections: WGL, RDA, FFTA and Hangar 1.

4.1 Primary Documents

Primary documents are developed by the Navy and initially provided as a draft. The draft primary documents are subject to a review period by EPA and MassDEP.

Following the Navy response to, and resolution of, comments on draft primary documents, a draft final version of a primary document is prepared. Following a regulatory concurrence period, the final primary document is prepared and issued. In accordance with FFA Section 10.2, primary documents include the following:

- Site Screening Process Work Plans;
- Site Screening Process Reports;
- RI/FS Work Plans;
- RI/FS Reports (including Baseline Risk Assessments);
- FS Reports;
- Proposed Plans;
- Final Remedial Designs;
- Remedial Action Work Plans (to include the following as appropriate for the RA selected):
 - Schedules for Remedial Action;

-
- Remedial Action Sampling Plan;
 - Remedial Action Construction Quality Assurance Plan;
 - Remedial Action Environmental Monitoring Plan; and
 - Contingency Plan;
 - Long-Term Monitoring Plans;
 - Interim Remedial Action Reports;
 - Remedial Action Reports;
 - Operation and Maintenance Plans;
 - Preliminary Closeout Reports; and
 - Final Closeout Reports.

4.2 Secondary Documents

Secondary documents include those documents that are discrete portions of the primary documents and are typically input or feeder documents. Secondary documents are issued by the Navy in draft subject to review and comment by EPA and MassDEP. Although the Navy will respond to comments received, the draft secondary documents may be finalized in the context of the corresponding draft final primary documents. Secondary documents include:

- Community Relations Plan Updates;
- Engineering Evaluation/Cost Analysis Reports;
- Removal Action Memoranda;
- Non-Time Critical Removal Action Plans (40 CFR 300.415[b][4][ii]);
- Pilot/Treatability Study Work Plans;
- Pilot/Treatability Study Reports;
- Well Closure Methods and Procedures;
- Preliminary/Conceptual Remedial Designs, or equivalents;
- Pre-Final Remedial Designs;
- Periodic Review Assessment Reports;
- Sampling and Data Results; and
- Initial Screening of Alternatives.

4.3 Durations

The BCT has agreed to the following response and revision timeframes for primary and secondary documents:

- Draft EPA/MassDEP review: 30 days (15-day extension);
- Navy response letter: 30 days (15-day extension);
- BCT consensus on comment response: 30 days (15-day extension);
- Navy draft final: 30 days (20-day extension); and
- Draft final becomes final within 30 days if no dispute resolution.

The FFA provides a provision to extend a timetable, deadline, or schedule for good cause. Proposed Plans and Action Memoranda schedules are contingent upon a minimum 30-day public comment period and, if requested, a minimum 30-day extension to the public comment period.

The SMP is reviewed and revised as necessary each year. The review cycle is as follows:

- Discussion within 90 days of budget with EPA/MassDEP, Natural Resources Trustees, and Restoration Advisory Board and community members; amended SMP submitted by 15 June of the following year;
- 30-day review/comment period;
- 30 days to develop draft final; and
- 21-day review.

The final SMP is submitted within 30 days after the BRAC PMO receives official notification of its BRAC funding allocation for that fiscal year. If funding is less than proposed in the draft final SMP, there will be a 30-day consultation period to develop the final SMP.

5.0 FORMER NAS SOUTH WEYMOUTH BRAC CLEANUP TEAM

Pursuant to placement of NAS South Weymouth on the NPL, the BCT was established to facilitate implementation of the IR Program in accordance with CERCLA/SARA and the NCP. The core of the Project Team is the BCT, which is led by the BRAC Environmental Coordinator and includes representatives from EPA and MassDEP. Supporting the BCT are members of the Project Team, which includes technical specialists from EPA, MassDEP, NAS South Weymouth Caretaker Site Office, NAVFAC, Navy BRAC PMO Northeast, and contractors. The BCT and Project Team meetings provide a forum for addressing environmental cleanup matters and related reuse issues.

The BCT has participated in the development of this SMP and will use it as a management tool for implementation of the IR Program. The BCT will update the SMP on an annual basis to adjust priorities and schedules as new information becomes available.

6.0 RELEVANT DOCUMENTS

Documents that are relevant to the IR Program sites are listed in the Administrative Record Index for former NAS South Weymouth. A list of these documents has been compiled and is included as Table 6-1. The documents are available at the local information repositories which include the public libraries in Abington, Hingham, Rockland, and Weymouth, and the Caretaker Site Office, Building 11, on Shea Memorial Drive at former NAS South Weymouth.

Shaded areas in green indicate milestones that have been achieved.

Note (1) IOA is comprised of four sites, AOC 14, AOC 83, RIA 33 and RIA 82, and the surrounding areas. Schedule assumes IOA is defined as a single site in the PRAP and ROD.

**RIA Milestone and Deliverable Schedules
Former NAS South Weymouth, MA
Site Management Plan Annual Update No. 15**

RIA	Site Name	Draft Data Gap Investigation Work Plan	Regulatory comments due	RTCs/Final Work Plan	Implement Field Program	Prepare Draft Final DD	Regulatory comments due	RTCs/pre-final DD	Regulatory Concurrence	RTCs/Final DD	Final Concurrence
111	Old Hangar 2	09/30/16	10/30/16	11/29/16	12/29/16	05/13/17	06/12/17	07/12/17	08/11/17	09/10/17	10/10/17
		Note (1)				Note (2)					

Green-shaded areas indicate milestones that have been achieved.

Note (1) Assume BCT meeting will be conducted by March 2016 to discuss scope. Completion of UFP SAP on hold until investigation work plan completed.

Note (2) Assumes field program provides sufficient information to complete draft final Decision Document. Possible transfer to MCP. If designated an AOC, a streamlined human health risk assessment or removal action followed by PRAP and ROD would add a minimum of 9 months.

8	5/15/14	7/18/14	9/30/2014 ³	1/30/15	3/20/15	9/30/15
9	5/15/15	7/9/15	9/30/2015 ³	1/30/16	3/20/16	4/19/16

Green-shaded areas indicate milestones that have been achieved. LTM commenced in 2007.

¹ Semi-annual monitoring began in Year 3 (2009), following 2 years of quarterly events.

² Annual reports cover LTM and O&M activities and include the annual Land Use Control Compliance Inspection checklist.

³ GW, SW, or SD sampling will not be performed during the Fall LTM events per 2013 LTM updates.

LTM Activities:

Revised March 2013

1. Landfill gas monitoring - semi-annual (Mar/Sep)
2. Groundwater sampling and analysis - annual (Mar)
3. Surface water sampling and analysis - annual (Mar)
4. Groundwater elevations and surface water levels - semi-annual (Mar/Sep)
5. Sediment sampling and analysis - prior to each five-year review (Mar)
6. Settlement monitoring - prior to each five-year review (Mar)

Small Landfill Long-Term Monitoring Milestone and Deliverable Schedules
